Sharing

CHALLENGE

Driver display systems (or screenboards) are becoming more and more complex, while integrating highly critical with commodity functions. This trend will continue, leading to configurable multi-function displays (MFDs), as already seen in Avionics cockpits. This requires the possibility to run Safety-critical UI components, which are to be certified, and in parallel enable feature rich non-critical commodity UI.

The later requires the use of standard components, while focusing on a sophisticated UI representation (e.g. through 2D/3D acceleration and rendering through hardware). Safety-critical UI components will focus on a leaner approach in order to reduce risks and cost of the certification while using a pre-certified UI framework.

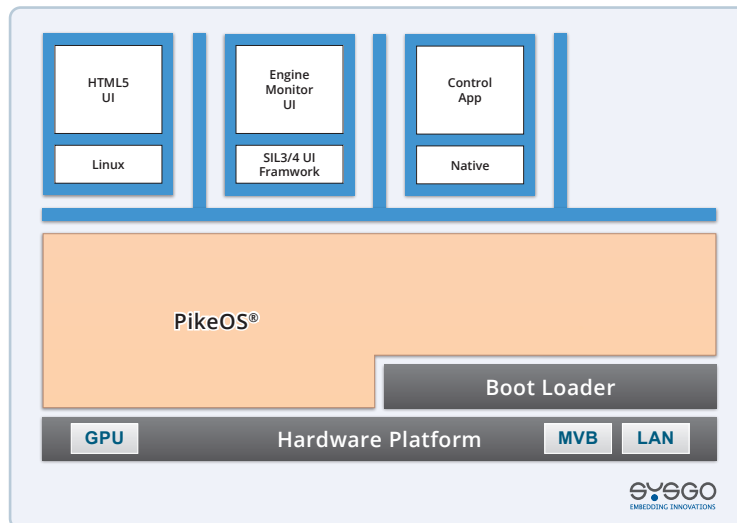

SOLUTION

In order to have a cost-effective commodity UI implantation, the feature richness of today's available UI frameworks have to be available. And the coexistence of UIs of different criticality requires a strict separation of functionality, while being able to share the same graphic hardware.

- The pre-certified PikeOS RTOS/Hypervisor allows you to use commodity functionality from an embedded Linux (e.g. HTML5) side-by-side with a pre-certified UI framework.

- The UI framework can share the GPU, while access to the GPU is controlled and managed by PikeOS.
- While implementing a feature-rich UI, PikeOS enables the concurrent execution of real-time tasks on the same platform.

PIKEOS SOFTWARE ARCHITECTURE

Founded in 1991, SYSGO became a trusted advisor for Embedded Operating Systems and is the European leader in hypervisor-based OS technology offering worldwide product life cycle support. We are well positioned to meet customer needs in all industries and offer tailor-made solutions with highest expectations in Safety & Security. More information at www.sysgo.com/railway
